EF TOOLKIT - NARROW SOFTWARE

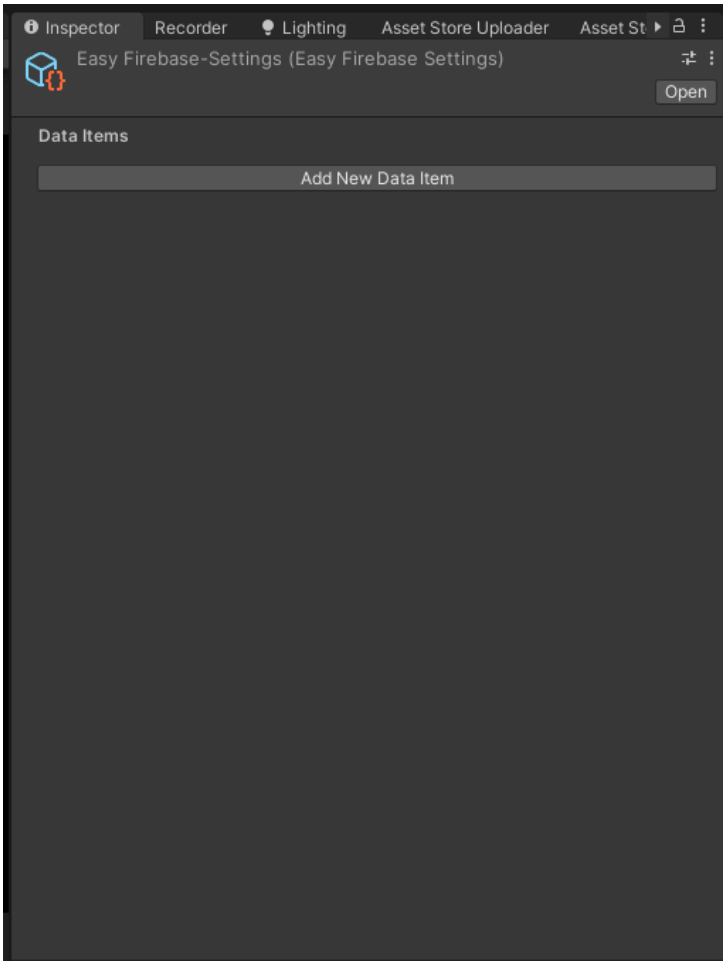
First of all, thank you for purchasing our asset and please import fb sdk to your project!

Setup

Clicking '**Setup**' in the initial setup window will be sufficient for the first step of installation. The Resources/NarrowNetwork/EF-Settings.asset file will be automatically created. You will then be able to add data for SimpleData from this window

Adding Data

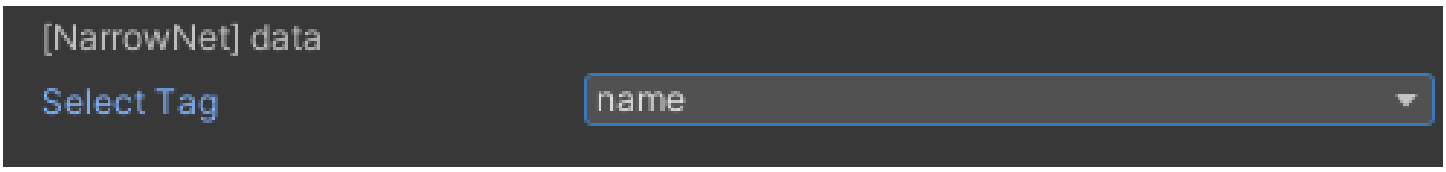
You can add new data from the EF-Settings.asset file. The Object type is valid as JSON..



Simple Data

You can easily select the objects you added through the ScriptableObject by adding a new SimpleData class and using the Inspector.

```
public SimpleData data;
```



Simple Data - Get Data

You can easily retrieve your data using GetData<TYPE>();

```
string name = await data.GetData<string>();
```

Simple Data - Set Data

If you want to save a JSON file, you can use SetData(jsonData); to save it. Otherwise, you need to use the specific functions for variables, such as SetString, SetInteger, and so on.

```
string name = await data.SetString("YOUR-NAME");
```

Simple Data - Add Integer

You can add to the existing integer value using AddInteger.

```
int coins = await data.AddInteger(25);
```

Simple Auth

Initialize Simple Auth within the Start method.

```
private SimpleAuth auth;

private void Start()
{
    auth.Initialize();
}
```

The following command returns an AuthResult class, from which you can retrieve the isSuccessful value and, if successful, the userId.

```
var result = await auth.SignUpWithEmail(sg_email.text,sg_password.text);
Debug.Log("Status : " + result.isSuccessful + " Id : " + result.userId);
```

SignInWithEmail and SignUpWithEmail accept the same parameters.
